

3. In a document file (.doc, .docx, .pdf, etc.), summarize your findings:

1. *Executive Summary: What are your main findings and recommendations, in a single paragraph?*
2. *Summarize the results of your initial analyses of overall giving and giving to UVA (1-3 paragraphs).*
3. *Describe a strategy for finding new potential sources of money for UVA. What countries or institutions should UVA target, and why? (1-3 paragraphs)*
4. *Conclude with a summary of UVA's prospects for increasing foreign giving. (1 paragraph).*

Foreign giving to U.S. universities is highly concentrated among a small number of countries and institutions, with Qatar, England, China, Saudi Arabia, and Bermuda providing the largest total amounts. UVA received approximately \$22.2 million in foreign gifts from 15 countries, placing it above Virginia Tech and William & Mary but substantially below comparable public universities such as the University of Michigan and University of North Carolina, Chapel Hill. Based on these findings, UVA should expand its international fundraising efforts by strengthening relationships with existing donors, particularly in England, while pursuing new opportunities in high-giving countries such as Qatar and examining the international funding networks of successful peer institutions. Targeting foreign organizations whose interests align with UVA's strengths in STEM, medicine, and engineering could help increase both the amount and diversity of UVA's foreign funding.

Overall, the majority of foreign giving to U.S. institutions was concentrated among a small number of countries and universities. Qatar provided the largest total amount at approximately \$2.71 billion, followed by England (\$1.46 billion), China (\$1.24 billion), Saudi Arabia (\$1.07 billion), and Bermuda (\$900 million). England had the most individual gifts (3,655), while Bermuda had the highest average gifts (\$7.69 million), demonstrating that gift frequency and total value can differ substantially. The largest recipients were Carnegie Mellon, Cornell, Harvard, MIT, and Yale, all prestigious private universities. Across all gifts, the mean was \$52.2 million compared with a median of \$6.49 million, indicating a strongly right-skewed distribution driven by a relatively small number of very large gifts.

Foreign giving to Virginia institutions was substantially lower, with a mean gift of approximately \$657,000 and a median of \$94,000, although the distribution remained strongly right-skewed. UVA received approximately \$22.2 million in foreign gifts from 15 countries, with Bangladesh, Sweden, Tanzania, Switzerland, and England providing the largest total amounts. England provided the most individual gifts to UVA (31), followed by Israel (12), Bangladesh (10), and Sweden (10). Thus, UVA's foreign giving shows the same general pattern seen nationally, where a relatively small number of large gifts account for a substantial portion of total giving.

Compared with peer institutions, UVA received substantially less foreign giving than the University of Michigan (\$287.3 million) and UNC (\$41.3 million)—out of state public

universities with comparative national rankings. However, its total was higher than Virginia state schools Virginia Tech (\$11.8 million) and William & Mary (\$3.38 million). The major donor countries also varied considerably between institutions: Michigan's largest donors included England, Japan, and China, while UNC's included Canada, Switzerland, and Zambia; Virginia Tech's included England, Spain, and Oman. Overall, UVA ranked below its national public-university peers in foreign giving but above its Virginia peers, suggesting that its foreign-giving profile is relatively modest compared with similarly prominent public universities nationally.

UVA should focus on countries and organizations that have both demonstrated a willingness to fund American universities and have interests that align with UVA's academic and research strengths. England would be a strong target because it provided the most individual gifts nationally and is already one of UVA's major foreign donors, while Qatar could represent an opportunity for expansion because it provided the largest total amount of foreign funding nationally but was not among UVA's top donors. UVA could also examine the foreign funding networks of successful peer institutions such as Michigan, identifying international corporations, foundations, universities, and other organizations that support their research. By targeting similar organizations and developing partnerships around areas such as STEM research, medicine, and engineering, UVA could expand its foreign funding while building on its existing strengths and connections.

UVA has meaningful potential to increase its foreign giving, particularly since it already receives more than other major Virginia public universities. However, its lower funding compared with national peers suggests significant room for growth. By strengthening existing international relationships and targeting high-giving countries and organizations aligned with UVA's strengths, UVA could expand both the amount and diversity of its foreign funding.
